SANIFLO toilets can be installed in places where conventional plumbing is difficult or impossible to do so.

SANIFLO toilet basement installation to complement the new entertainment room!

**H**ave you ever wished you had just one more bathroom...but pushed the thought aside because you don't have the "right" space; there are too many plumbing issues to overcome; or perhaps, the cost associated with major construction is too great?

SANIFLO is a plumbing solution that allows homeowners and businesses to add another bathroom regardless of the perceived issues, such as those mentioned here.

SANIFLO toilets can be installed in places where conventional plumbing is difficult or impossible to do so. Thanks to its unique macerating system, a SANIFLO toilet can be installed almost anywhere without compromising the building's foundation.

With SANIFLO, you can install a full or half bath. Matching sinks are available. The technology is

applicable to residential or commercial applications.

SANIFLO toilets have been well accepted in Europe since the 1960s and gaining in popularity in the United States for more than 15 years. Even if you haven't heard of them, chances are you've used one!

## How it Works

Traditional plumbing systems use gravity and large diameter pipe work to pump waste. Often, it is this requirement that makes it difficult—if not impossible—to add the desired additional bathroom. SANIFLO resolves this issue by using small-diameter pipe that can run virtually anywhere, across floor joists or in narrow floor or ceiling spaces. This prevents the need for major construction to accommodate the traditional plumbing operation.

Another way in which SANIFLO toilets differ from conventional plumbing systems is that they use a macerator, grinder and pump to process waste and deliver it to a standard sewer system (or related). The macerator and grinder work together (in stages) to ensure that even items that are accidentally introduced to the system are properly processed. (Discuss your usage and application with a qualified plumbing contractor.)

SANIFLO is safe, sanitary and reliable. All SANIFLO products are designed to pump waste into a city sewer, septic tank or soil stack. Maintenance is not required but a de-scaler can be used to clean the system to ensure peak performance.

Cocalico Plumbing & Heating is a mechanical contractor with a reputation for quality work that is completed on time and within budget. As a family-owned company, we know how to bring a personal touch to each job regardless of size.

We are master licensed in plumbing, factory-trained and EPA Certified in heating and cooling. We are fully bonded and insured. But more importantly, each Cocalico employee is squarely focused on pleasing the customer. Our dependable, skilled employees help us achieve constant quality, time after time.

For courteous, dependable service in plumbing, heating, cooling, indoor air quality, preventive maintenance and new home standard packages, call Cocalico.

SANIFLO's complementary sinks are stylish and attractive.

As a plumbing contractor, we've seen the negative outcome when DIY plumbing isn't done correctly. Avoid the costly problems by engaging a qualified contractor at the beginning of your project.

Half bath/powder room installed in a basement.  
No more running upstairs to use the restroom!

## SANIFLO APPLICATIONS

SANIFLO can go almost anywhere. No need to break up floors or knock down walls to add a new bathroom!

How can SANIFLO be used? Here are some popular applications.

- turn a basement closet into a half bath
- accommodate one-floor living by adding a first floor bath (half or full)
- add a bathroom to a pool house, barn or other out-building
- extend your living space by renovating your attic (assuming it's already a livable space) and adding a bath
- expand your business with a new bath (half or full)
- add a bathroom to the garage or work shop

Most SANIFLO products require 115 volts and must be plugged into a GFI receptacle. A dedicated circuit is not required. Some models require 220/440 volts and must be hard wired. Qualified plumbers will help you select the product that is right for your unique application.

### DIY or Not?...NOT!!!

Can you install SANIFLO yourself? Although it sounds uncomplicated because major construction is not required, installing SANIFLO still requires complex connections to sewer (or septic/soil stacks) and electrical hook ups. Because waste is involved, we always recommend that you engage a qualified plumbing contractor. Don't worry, that still does not equal the expense that would be incurred with a conventional plumbing system.

As a plumbing contractor, we've seen the negative outcome when DIY plumbing isn't done correctly. Avoid the costly problems by engaging a qualified contractor at the beginning of your project.

There are many reasons to add a bathroom to your home, including increasing the home's value and adding convenience.

If a SANIFLO toilet or even complete bathroom solution sounds like it might be a fit for your home or business, call Cocalico Plumbing and Heating at 336.3454 to discuss your options. We're known for providing unbiased support to customers who are thinking about a renovation project and can help you weigh the best options for your unique need.
